

Hand-held concrete crusher is used for concrete breaking and can be operated by one person. Less vibration and impulsive noise along the structure would be generated by hand-held concrete crusher than jackhammer. The sound pressure level at 7m from the working site is less than 70dB(A). The Crusher can exert a force of up to 50 tonnes. The concrete breaks, exposing any reinforcement contained within the structure.

The concrete crusher is ideal for removing:

- Staircases
- Floor Slabs
- Walls
- Other reinforced concrete structures.

Crushing Case:
